

EXP 12**Security and Governance in Zoho Creator****AIM**

To study and implement security and governance features in Zoho Creator to protect application data, control user access, and ensure secure application management.

PROBLEM STATEMENT

A hotel uses Zoho Creator to manage customer details, room bookings, and payments. Unauthorized access to sensitive information could cause data leakage or misuse.

SOLUTION

- Admin: Can manage users, bookings, and application settings.
- Manager: Can view and manage bookings and room availability.
- Employee: Can enter customer details and view assigned booking records.
- Access Control: Configure permissions for forms, reports, and records.
- Data Protection: Restrict access to sensitive customer and payment information.
- Monitoring: Review access permissions and audit information where available.

Expected Result: The hotel booking application provides controlled access to data and reduces the risk of unauthorized activities.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	User roles created	Access categorized by role
2	Permissions configured	Unauthorized access restricted
3	Record-level access applied	Records controlled according to permissions
4	Different roles tested	Access rules verified
5	Security settings reviewed	Application security improved

PROCEDURE:

1. Log in to Zoho Creator and create or open an application.
2. Create user roles such as Admin, Manager, and Employee.
3. Configure permissions to control access to forms, reports, and records.
4. Set field permissions and record-level access rules.
5. Configure authentication and sharing settings to protect sensitive data.
6. Test the application using different user roles.
7. Verify that users can access only the data and features permitted to them.

RESULT

Security and governance features were studied and configured in Zoho Creator to control user access and protect application data.

CONCLUSION

Thus, security and governance in Zoho Creator were studied successfully. Role-based permissions, access controls, authentication, and monitoring help protect sensitive information and ensure secure application management.
