EXP 14	Pro-Code Extension Using Zoho Catalyst

AIM

To study the integration of Zoho Catalyst with the Library Book Issue Management application to extend its functionality using custom code and backend services.

THEORY

Zoho Catalyst is a pro-code development platform that enables developers to build and deploy backend services, APIs, and serverless functions.

Key features include:

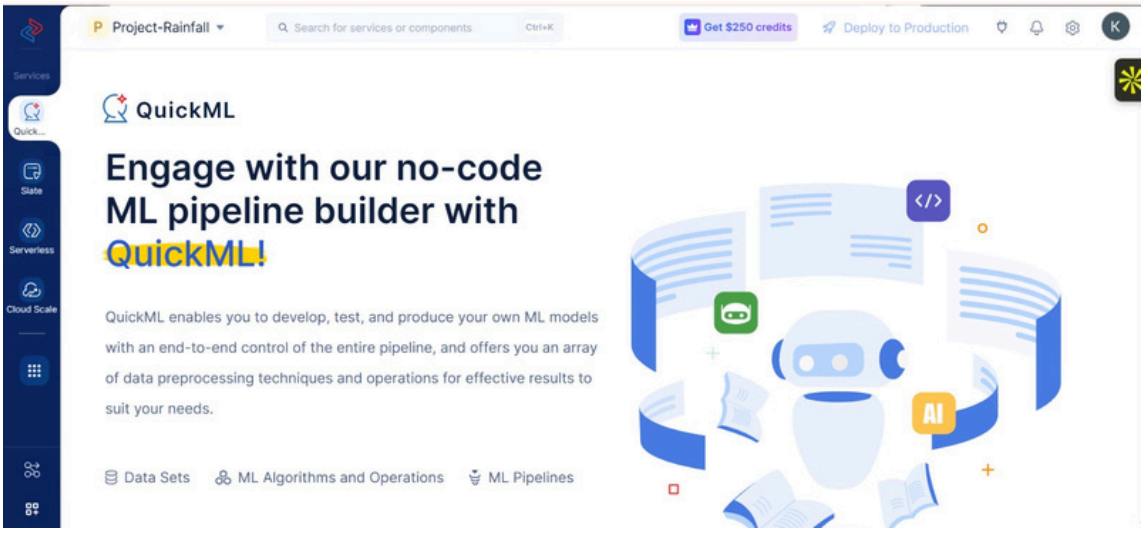

- Serverless Functions: Execute custom logic for booking management and validation.
- API Integration: Connect Zoho Creator with external services through APIs.
- Data Processing: Process booking records and calculate room charges.
- Automation: Extend existing workflows with custom backend logic.
- Scalability: Support application functionality through cloud-based services.

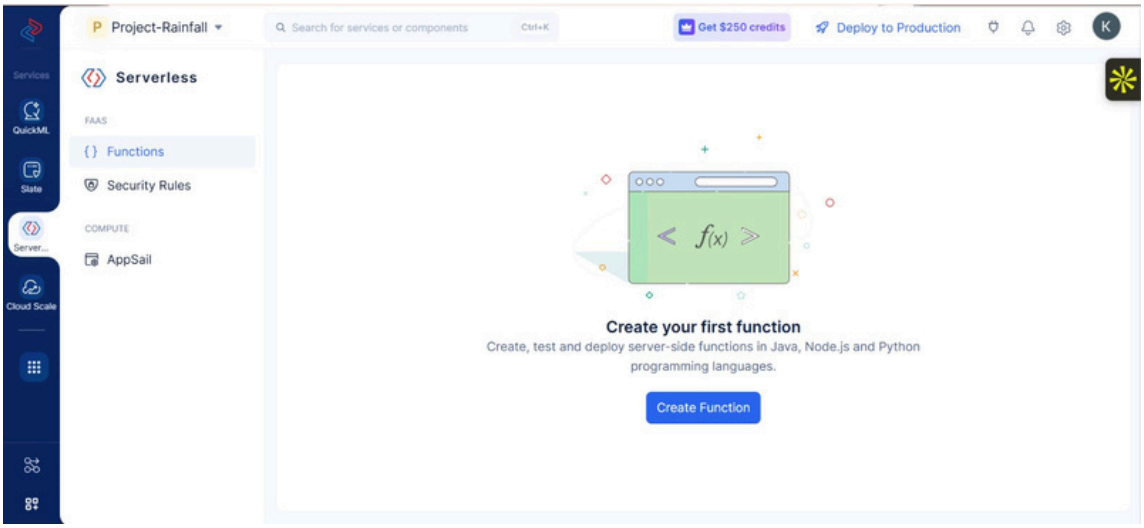

PROCEDURE

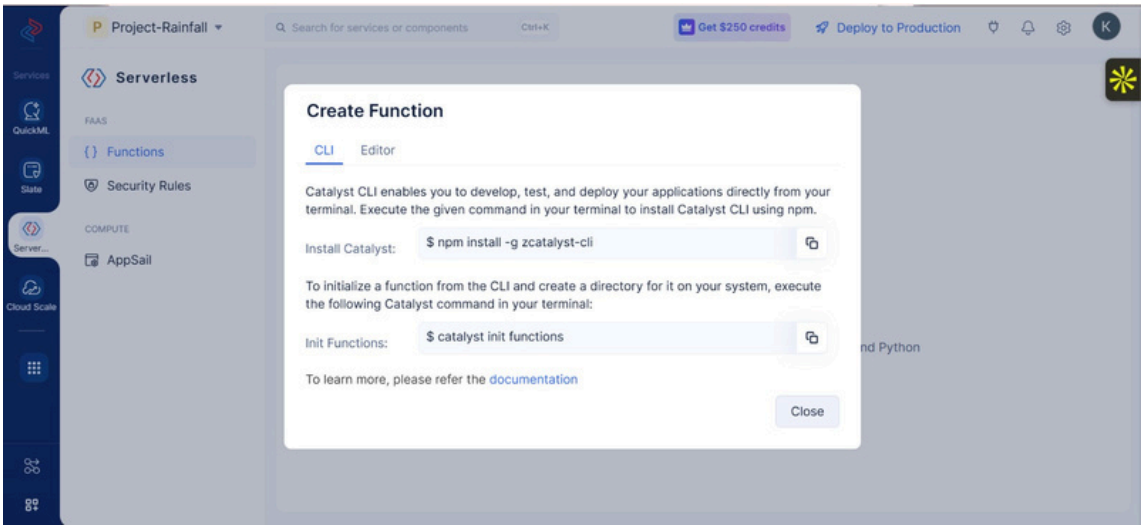

1. Logged in to the Zoho Catalyst platform.
2. Created a Catalyst project named Project-Rainfall.
3. Opened the Serverless Functions section.
4. Created a serverless function named bookRequestValidator using Node.js 24 and Basic I/O.
5. Implemented custom logic to validate book titles and borrower names.
6. Tested the function using sample library book request details.
7. Verified the function response using the Catalyst test console.
8. Obtained the development function URL.
9. Created a workflow named Catalyst Book Request Validation in the Zoho Creator Book_Issue_Request_Form.
10. Added a Deluge script using invokeurl to call the Catalyst function.

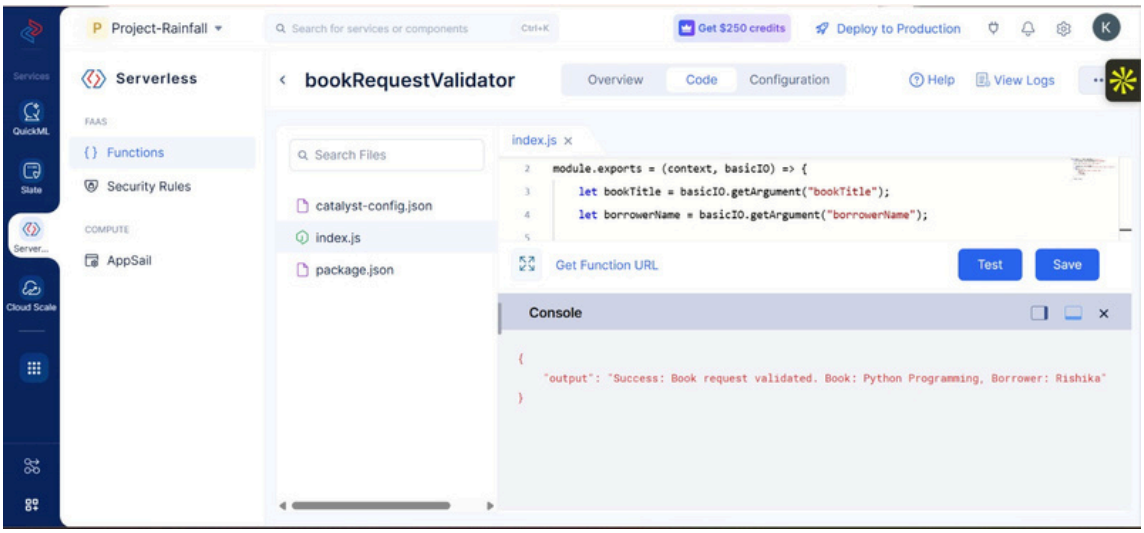

APPLICATION

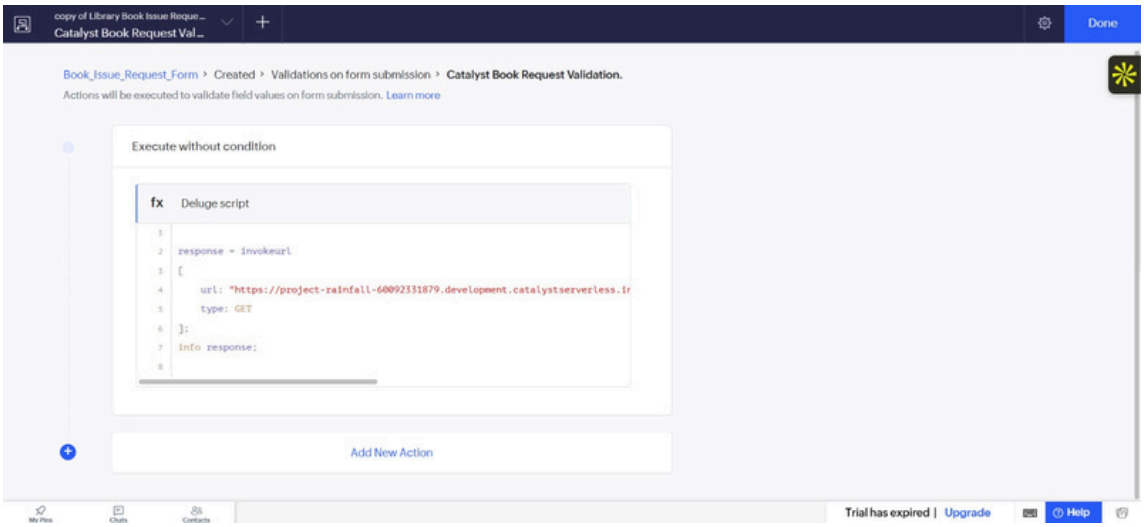

In the Library Book Issue Management application, Zoho Catalyst extends backend functionality by validating book request details through a serverless function. The function checks whether the book title and borrower name are provided and returns an appropriate success or error message. The Catalyst endpoint can be integrated with Zoho Creator workflows to extend request processing using custom backend logic.

CLI
Editor
Catalyst CLI enables you to develop, test, and deploy your applications directly from your terminal. Execute the given command in your terminal to install Catalyst CLI using npm.
Install Catalyst:
$ npm install -g zcatalyst-cli
To initialize a function from the CLI and create a directory for it on your system, execute the following Catalyst command in your terminal:
Init Functions:
$ catalyst init functions
To learn more, please refer the documentation
Close

RESULT:

Successfully created and tested the bookRequestValidator serverless function in Zoho Catalyst using Node.js 24. The function validated sample library book request details and returned the expected success or error message. A Zoho Creator workflow was configured to call the Catalyst endpoint for further integration testing.
